Naive energy from the total charge with one calibration constant $k = \text{median}(Q/E)$ per configuration
(a) Bias of $\hat{E} = Q/k$
Bias: median of $\hat{E}/E - 1$ [%]
Vertex radius r_0 [m]
(b) Resolution (pooled over the energy prior)
Resolution: 68 % half-width of $\hat{E}/E$ [%]
Vertex radius r_0 [m]
straight
absorb (= straight + absorption)
absorb-scatter
full
straight + scattering
straight + reflection
